About Language Structure	
Sentences are not just strings of words.	
Words cluster into larger units called phrases, based	
on their grammatical category.	
Noun (N) = girl, goblin, dream, laughter,	
Determiner (Det) = a, the, an, these,	
Adjective (Adj) = lovely, stinky, purple,	
Verb (V) = laugh, dance, see, defeat,	
Adverb (Adv) = lazily, well, rather,	
Preposition (P) = with, on, around, towards,	
Freposition (F) - with, on, around, towards,	
	1

Noun Phrases (NP)

About Language Structure

Sentences are not just strings of words. Words cluster into larger units called phrases.

About Language Structure

Things that phrases can do:

Have pro-forms replace them

pro-forms: words that have minimal specific meaning and which can stand in for phrases ("he", "she", "there", "here", "do so")

The girl who ate the peach and forgot everything saved Hoggle in the goblin city.

About Language Structure	
Things that phrases can do:	
Trings that privates out to.	
Have pro-forms replace them	
pro-forms: words that have minimal specific meaning and which can stand in for phrases ("he", "she", "there", "here",	
"do so")	
She saved Hoggle in the goblin city.	-
The girl who ate the peach and forgot everything saved Hoggle there.	
The girl who did so saved Hoggle in the goblin city.	
About Language Structure	
Things that phrases can do:	
Have pro-forms replace them pro-forms: words that have minimal specific meaning and	
which can stand in for phrases ("he", "she", "there", "here",	
"do so")	
* She Hoggle in the goblin city. (she saved ≠ phrase)	
* The girl who ate the peach and forgot everything saved Hoggle in the it. (goblin city ≠ phrase)	
The girl who did so Hoggle in the goblin city. (ate the peach and forgot everything saved ≠ phrase)	
About Language Chruchure	
About Language Structure	
Things that phrases can do:	
Be conjoined to other phrases of the same kind: use "and"	
The girl who ate the peach and forgot everything saved Hoggle.	

About Language Structure Things that phrases can do: Be conjoined to other phrases of the same kind: use "and" The girl who ate the peach and forgot everything saved Hoggle. Ludo saved Hoggle. He saved Hoggle. Ludo = NP	
	1
About Language Structure	
Things that phrases can do:	
Be conjoined to other phrases of the same kind: use "and"	
Ludo and the girl who ate the peach and forgot everything saved Hoggle.	
Ludo = NP	
The girl who ate the peach and forgot everything = NP	
	1
About Language Structure	
Things that phrases can do:	<u> </u>
Be conjoined to other phrases of the same kind: use "and"	
The girl who and Ludo ate the peach and forgot everything saved Hoggle.	
Ludo = NP	
The girl who ≠ NP	

About Language Structure	
Things that phrases can do:	
Move around in the sentence without making the sentence	
sound too odd	
The girl who ate the peach and forgot everything saved Hoggle in the goblin city.	
About Language Structure	
Things that phrases can do:	
Move around in the sentence without making the sentence sound too odd	
In the goblin city, the girl who ate the peach and forgot everything saved Hoggle.	
In the goblin city = PP	
About Language Structure	
Things that phrases can do:	
Move around in the sentence without making the sentence sound too odd	
* Who ate the, the girl peach and forgot everything saved Hoggle in the goblin city.	
who ate the ≠ phrase	

About Language Structure

Things that phrases can do (summary):

Be replaced by very generic single word forms (pro-forms)

Be conjoined to other phrases of the same kind

Move around in the sentence without making the sentence sound too odd

Computational Problem

How do children figure out which words belong together (as phrases) and which words don't?

Learning Phrases

One way we've seen that children can learn things is by tracking the statistical information available.

Saffran, Aslin, & Newport (1996):

Transitional Probability is something 8 month olds can track

who's afraid of the big bad wolf

Posit a word boundary at the minimum of the transitional probabilities between syllables

Learning Phrases	
One way we've seen that children can learn things is by tracking	
the statistical information available.	
Thompson & Newport (2007):	-
Transitional Probability to divide words into phrases?	
the girl and the dwarf	
Posit a phrase where the transitional probability is high?	
A look at real language properties in action with	
transitional probabilities	
Example: Optional phrases	
A B C D E F	
A B C D E F The goblin easily steals the child.	
A look at real language properties in action with	
transitional probabilities	
Example: Optional phrases	
A D O D E E	
A B C D E F The goblin easily steals the child.	
ABCDEF	
words break up into phrases.	

A look at real language properties in action with transitional probabilities	
Example: Optional phrases	
A B C D E F	
The goblin easily steals the child.	_
ABCDEF But suppose C is an optional word/phrase. (easily is an adverb that can be left out)	
ABDEF Data without C sometimes will appear.	
The goblin steals the child.	-
A look at real language properties in action with transitional probabilities	
Example: Optional phrases	
A B C D E F The goblin easily steals the child.	
ABCDEF ABCDEF With the optional phrase left out, the transitional probability of (BC) is less than 1. A transitional probability learner posits a phrase boundary there. Conclusion: AB is a unit, CDEF is a unit. the goblin (= NP) easily steals the child (= VP)	
The goblin steals the child.	
A look at real language properties in action with transitional probabilities	
Example: Optional phrases	
A B C D E F	
The goblin easily steals the child. With the optional phrase put in, the transitional probability of (BD) is less	
ABCDEF than 1. A transitional probability learner posits a phrase boundary	
there. Conclusion: AB is a unit, DEF is a unit. the goblin (= NP) steals the child (= VP)	
The goblin steals the child.	

Artificial Language Experiments	
Adults listened to data from an artificial language for 20 minutes on multiple days	
Properties of the artificial language: similar to real language properties	
optional phrases (the goblin chased a chicken <i>in the castle</i>) repeated phrases (NP Verb NP)	
moved phrases (In the castle the goblin chased a chicken)	
	7
Artificial Language Experiments	
Baseline pattern: ABCDEF real language parallel	
A B C D E F	
The goblin easily steals the child.

How do we tell if learning happened? Baseline assessment: Can subjects actually realize all these nonsense words belong to 6 distinct categories? Can they categorize? kof hox jes sot fal ker is the same as daz neb tid zor rud sib	
See if they can tell the difference between the correct order they were exposed to (ABCDEF) and some other pattern they never heard (ABCDCF) kof hox jes sot fal ker is right kof hox jes sot rel ker is wrong	
	1
How do we tell if learning happened?	
Phrase learning assessment: If they can categorize, do they learn what the phrases are (AB CD EF)?	
Example: test between AB and non-phrase BC	
Sample test item - which one do they think belongs together?	
kof hox vs. hox jes	
Learning a language with optional phrases	
Baseline pattern: ABCDEF	
Other patterns heard (phrases AB CD EF missing): CDEF, ABEF, ABCD	
kof hox jes sot fal ker rel zor taf nav mer neb rud sib daz lev tid lum	
Control subjects: Control language (remove one adjacent pair at a time) Control patterns heard: ABCDEF, BCDE, CDEF, ABEF, ABCF, ABCD	

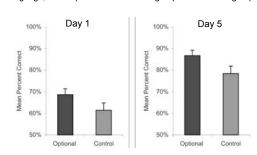

Learning a language with optional phrases

Transitional Probabilities in the Optional Phrase language and the Control language are different. The Optional Phrase language has lower probability across phrase boundaries than within phrases. The control language has the same probability no matter what.

	$A \rightarrow B$	$B \rightarrow C$	$C \rightarrow D$	$D \rightarrow E$	$E \rightarrow F$
Optional phrases	1.00	0.80	1.00	0.80	1.00
Optional control	0.90	0.90	0.90	0.90	0.90

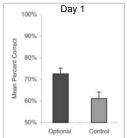

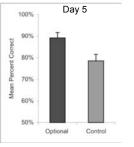

Above chance performance, improvement with more exposure to language, similar performance for test group as for control group

Optional Language Learning: Phrases

Test group with informative transitional probabilities generally doing better than the control group with uninformative probabilities.

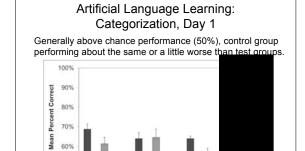

Learning a language with repeated phrases	
Baseline pattern: ABCDEF	
Other patterns heard (phrases AB CD EF repeated): ABCDEFAB, ABCDEFCD, ABCDEFEF	
kof hox jes sot fal ker kof hox rel zor taf nav daz neb mer neb jes zor rud sib tid sot daz lev tid lum fal nav taf ker	
Control subjects: Control language (repeat one adjacent pair at a time) Control patterns heard: ABCDEF, ABCDEFAB, ABCDEFBC, ABCDEFCD, ABCDEFDE, ABCDEFFA	
Learning a language with repeated phrases	
Transitional Probabilities in the Repeated Phrase language and the	
Control language are different. The Repeated Phrase language has lower probability across phrase boundaries than within phrases. The control language has almost the same probability no matter what.	
$A \rightarrow B$ $B \rightarrow C$ $C \rightarrow D$ $D \rightarrow E$ $E \rightarrow F$	
Repeated phrases 1.00 0.86 1.00 0.86 1.00 Repeated control 0.92 0.94 0.92 0.94 0.93	
Learning a language with moved phrases	
Baseline pattern: ABCDEF	
Other patterns heard (phrases AB CD EF moved): ABCDEF, ABEFCD, CDABEF, CDEFAB, EFABCD, EFCDAB	
Example strings heard: kof hox jes sot fal ker daz neb rel taf nav zor	
Control subjects: Control language (move one adjacent pair at a time) Control patterns heard:	
ABCDEF, ABEFCD, CDABEF, CDEFAB, EFABCD, EFCDAB, BCAFDE, AFDEBC, DEAFBC, DEBCAF	

Learning a language with moved phrases

Transitional Probabilities in the Moved Phrase language and the Control language are different. The Moved Phrase language has lower probability across phrase boundaries than within phrases. The control language has the same probability no matter what.

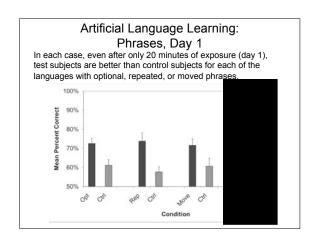

00	$A \rightarrow B$	$B \rightarrow C$	$C \rightarrow D$	$D \rightarrow E$	$E \rightarrow F$
Moved phrases	1.00	0.60	1.00	0.60	1.00
Moved control	0.78	0.78	0.78	0.78	0.78

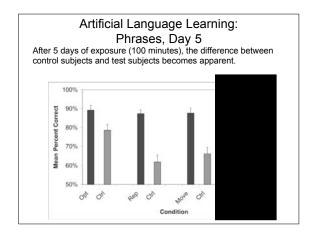

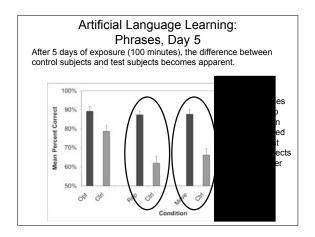

Condition

50% ON

Artificial Language Learning: Categorization, Day 5 General improvement, though test groups still a little better than control groups. Still, subjects generally capable of categorization.

Learning a language with optional phrases, repeated phrases, and moved phrases

Baseline pattern: ABCDEF

Other patterns heard (phrases AB CD EF moved):
CDEF, ABEF, ABCD, ABCDEFAB, ABCDEFCD,
ABCDEFEF, ABCDEF, ABEFCD, CDABEF, CDEFAB,
EFABCD, EFCDAB

	$A \rightarrow B$	$B \rightarrow C$	$C \rightarrow D$	$D \rightarrow E$	$E \rightarrow F$
All-combined	1.00	0.33	1.00	0.22	1.00
All-combined control	0.67	0.71	0.58	0.59	0.47

Transitional Probabilities in the "All-combined" language and the Control language are different. The "All-combined" language has lower probability across phrase boundaries than within phrases. The control language probabilities are more uniform, though they do vary.

Predictions for all-combined?

One idea: Harder

Why? There are many more patterns that are acceptable for the artificial language. Even if transitional probability is informative, it's a lot of information to track.

Prediction: Test subjects don't do much better than control subjects.

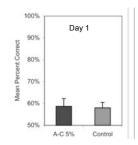

Second idea: The same, or easier.

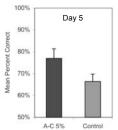

Why? There are many more patterns that subjects' minds can catch. If even one of the variations (optional, repeated, moved phrases) is helpful, three of these will be even more helpful.

Prediction: Test subjects do much better than control subjects.

Artificial Language: Categorization

Test subjects do about as well as control subjects for being able to categorize. This is good, since it means subjects can abstract across the novel words.

Artificial Language: Phrases	
Test subjects much better than control subjects. Second prediction is supported: finding phrases is easier when more variations are	
available, even though there are more patterns to learn.	
Day 1 Day 5	
Negan D	
60% - F	
50% A-C 5% Control A-C 5% Control	
Statistically Learning Phrases	
Thompson & Newport (2007): Adults can learn phrases in	
artificial languages if there are "sentences" that show the kinds of variation real sentences can have.	
Interesting: When there are more variation types (optional, repeated, and moving phrases), adults are even better at unconsciously identifying phrases.	
Open Question: How well will this work for real language	
data? (Remember Gambell & Yang (2006) found that transitional probabilities don't work so well for word	
segmentation when the data is realistic.)	
Questions?
