Psych 156A/ Ling 150:

## Psychology of Language Learning

Lecture 2
The Learning Mechanism

| Announcements |
| :--- |
| Homework 1 is now posted on the class website. |
| It will be due 1 week from today (4/10/08), to be |
| handed in during class. A typed document is much |
| preferred for legibility. |
| Waitlist: Add/drop cards will be signed after week 2. |
| Until then, please use the electronic add/drop |
| system. |

## Stages of acquisition

Stage 1 (first few months): "cooing" vocalization "goo goo ga ga"
$\qquad$
$\qquad$
Stage 2 (~6 months): "babbling"
strings of syllables using a wide range of sounds (some sounds aren't even those used in native language) eneral consensus: baby playing with the vocal tract
deaf babies do it (in the absence of auditory input)
deaf babies exposed to sign language babble with their hands, too
not all babie
after a few months, babbling takes on intonation patterns of native language

## Stages of acquisition

Stage 3 (~10-20 months): single word utterances "Mommy!" "Juice!" "Up!" (surprisingly communicative)
$\qquad$
Within 6 months: child's vocabulary grows to $\sim 50-100$ words

Stage 4 (~24 months): two word utterances
"Mommy sock" "Drink soup" "No eat

Consistent use of word order, even though not all words are used
"Mommy should throw the ball"

$$
\begin{array}{ll}
\text { Mommy throw } & \text { Not "throw Mommy" } \\
\text { Throw ball } & \text { Not "ball throw" }
\end{array}
$$

Stages of acquisition
Stage 4 continued ( $\sim 24$ months): vocabulary spurt
Parents can't keep track of all the words their child knows
Estimate: 10,000 words by 5 years old
This works out to about 1 per waking hour from ages 2 to 5
years old! (Child likely working on multiple words at once, too.)
Stage $5(\sim 30$ months): grammatical growth
Child constructs longer and more grammatically complex sentences
By age 5: Very good approximation of adult word order rules, though
there are still some wrinkles to be worked out
(From Martin Braine)
Child: Want other one spoon, Daddy.
Father: You mean, you want the other spoon.
Cind: Yes, I want other one spoon, please Daddy.
Father: Can you say "the other spoon"?
Child: Other....one...spoon.
Father: Say "other".
Child: Other.
Father: "Spoon."
Child: Spoon.
Father: "Other spoon."
Child: Other...spoon. Now give me other one spoon?
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

| An Example Wrinkle |
| :--- |
| (From Martin Braine) |
| Child: Want other one spoon, Daddy. |
| Father: You mean, you want the other spoon. |
| Child: Yes, I want other one spoon, please Daddy. |
| Father: Can you say "the other spoon"? |
| Child: Other...one...spoon. |
| Father: Say "other". |
| Child: Other. |
| Father: "Spoon." |
| Child: Spoon. |
| Father: "Other spoon." |
| Child: Other...spoon. Now give me other one spoon? |
| An important point for learning: Corrective feedback not always heeded. |

$\qquad$
$\qquad$
Child: Want other one spoon, Daddy.
Father: You mean, you want the other spoon
Fild: Yes, I want other one spoon, please Daddy $\qquad$
Child: Other...one...spoon.
ather: Say oth
Father: "Spoon."
Child: Spoon.
Father: "Other spoon."
Child: Other...spoon. Now give me other one spoon?
$\qquad$
$\qquad$
$\qquad$

Knowing more than they say $\qquad$
Phonology (sound system):
Children often simplify the sounds of words.
Ex: spoon becomes "poon
"bus" becomes "buh"
"duck" becomes "guck
"truck" becomes "guck"
$\qquad$
$\qquad$
$\qquad$
But children comprehend more than they can produce sound-wise. A child who says "guck" for "duck" and "truck" will have no problem distinguishing ducks from trucks when asked.
"If you deliberately pronounce a word the way your child does, he or she will get mad at you and tell you to say it right. If you tell your child to say 'duck', not 'guck', most of the time you'll get "guck" and a blank stare." 'duck', not 'guck',
Jackendoff (1994)

## Knowing more than they say

$\qquad$
Syntax (word order system):
Can test children who are in the 1-word stage on their understanding of word order rules (which involve more than 1 word).
(Hirsh-Pasek \& Golinkoff: 17-month olds)

Main points
Children understand more than they can imitate.
(Comprehension greater than production)
Children don't just imitate what they've heard - they're trying to
figure out the patterns of their native language.
The patterns they produce during learning are often stripped-down
versions of the adult pattern, but they make mistakes that cannot
be attributed directly to the input.

Describing vs. Explaining $\qquad$
$\qquad$
"...it gradually became clear that something important was missing that was not present in either of the disciplines of neurophysiology or $\qquad$ psychophysics. The key observation is that neurophysiology and psychophysics have as their business to describe the behavior of cells or of subjects but not to explain such behavior....What are the problems in doing it that need explaining, and what level of description should such explanations be sought?" - Marr (1982)

$\qquad$
$\qquad$
$\qquad$
$\qquad$

## On Explaining (Marr 1982)

"...[need] a clear understanding of what is to be computed, how it is to be done, the physical assumptions on which the method is based, and some kind of analysis of the algorithms that are capable of carrying it out." $\qquad$
"This was what was missing - the analysis of the problem as an information-processing task. Such analysis does not usurp an understanding at the other levels - of neurons or of computer programs but it is a necessary complement to them, since without it there can be no real understanding of the function of all those neurons."

## On Explaining (Marr 1982)

$\qquad$
"But the important point is that if the notion of different types of understanding is taken very seriously, it allows the study of the information-processing basis of perception to be made rigorous. It becomes possible, by separating explanations into different levels, to make explicit statements about what is being computed and why and to construct theories stating that what is being computed is optimal in some sense or is guaranteed to function correctly. The ad hoc element is removed..."

$\qquad$
$\qquad$
"But the important point is that if the notion of different types of understanding is taken very seriously, it allows the study of the information-processing basis of perceptionto be made rigorous. It becomes possible, by separating expfanations into different levels, to make explicit statements about what is being computed and why and to construct theories stating that what is being computed is optimal in some sense or is guaranteed to function correctly. The ad hoc element is removed...
$\qquad$
$\qquad$
$\qquad$

Our goal: Substitute "language learning" for "perception"
$\quad$ The three levels
Computational
What is the goal of the computation? What is the logic of the
strategy by which is can be carried out?
Algorithmic
How can this computational theory be implemented? What is
the representation for the input and output, and what is the
algorithm for the transformation?
Implementational
How can the representation and algorithm be realized physically?
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

The three levels:
An example with the cash register

## Computationa

What does this device do? Arithmetic

Task: Master theory of addition.

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

The three levels:
An example with the cash register
Computational
What does this device do? Arithmetic.

Task: Master theory of addition.

Algorithmic (Addition)
Addition: Mapping of a pair of numbers to another number

$$
(3,4) \longrightarrow 7 \quad \text { (often written }(3+4=7) \text { ) }
$$

Properties: $(3+4)=(4+3)$ [commutative], $(3+4)+5=3+(4+5)$ [associative] $(3+0)=3$ [identity element], $(3+-3)=0$ [inverse element]
True no matter how numbers are represented: this is what is being computed

## The three levels

$\qquad$

Marr (1982)
"Although algorithms and mechanisms are empirically more accessible, it is the top level, the level of computational theory, which is critically important from an information-processing point of view. The reason for this is that the nature of the computations that underlie perception depends more upon the computational problems that have to be solved than upon the particular hardware in which their solutions are implemented. To phrase the matter another way, an algorithm is likely to be understood more readily by understanding the nature of the problem being solved than by examining the mechanism (and the hardware) in which it is embodied."

## Mapping the Framework:

## Algorithmic Theory of Language Learning

Goal: Understanding the "how" of language learning
First, we need a computational-level description of the learning problem.

Computational Problem: Divide sounds into contrastive categories

Mapping the Framework: Algorithmic Theory of Language Learning

Goal: Understanding the "how" of language learning
First, we need a computational-level description of the learning problem.
Computational Problem: Divide spoken speech into words
húwzəfréjdəvðəbİgbæ'dwə'lf
húwz əfréjd əv ðə bíg bæ'd wə'lf who's afraid of the big bad wolf

## Mapping the Framework:

Algorithmic Theory of Language Learning
Goal: Understanding the "how" of language learning
First, we need a computational-level description of the learning problem.
Second, we need to be able to identify the algorithmic-level description:

## Input = sounds, syllables, words, phrases,. .

Output = sound categories, words, words with affixes, grammatical categories, ... $\qquad$
Process the can take us from input to output: statistical learning, algebraic learning,...?

Considerations: input available to child, psychological plausibility of learning algorithm, hypotheses child considers
Framework for language learning
(algorithmic-level)
What are the hypotheses available (for generating the output from the input)?
Ex: general word order patterns
Input: words (adjective and noun)
Output: ordered pair
Adjective before noun (ex: English)
red apple
Noun before adjective (ex: Spanish)
manzana roja
apple red
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

| Framework for language learning <br> (algorithmic-level) |
| :--- |
| What are the hypotheses available (for generating the output from the input)? |
| Ex: general word order patterns |
| What data is available, and should the learner use all of it? |
| Ex: exceptions to general word order patterns |
| Ignore special use of adjective before noun in Spanish |
| Special use: If the adjective is naturally associated with the noun: |
| la blanca nieve |
| the white snow |
| Why not usual order? Snow is naturally white |

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
Framework for language learning

\[\)|  (algorithmic-level)  |
| :--- |

\]

What are the hypotheses available (for generating the output from the input)?
Ex: general word order patterns
What data is available, and should the learner use all of it?
Ex: exceptions to general word order patterns
How will the learner update beliefs in the competing hypotheses?
Ex: shifting belief in what the regular word order of adjectives and
nouns should be
This usually will involve some kind of probabilistic updating function.

## Announcement

Quiz 1 will happen next Tuesday (4/8/08) during the first 15-20 minutes of class. Remember it is an open-note non-collaborative quiz. It can draw from the material in the first two lectures and the reading (Jackendoff).
