

Sentiment Analysis

Improving results with complex
generated features

Lucas Silva & Dr.Pearl

Agenda

The field: Sentiment Analysis

Silva & Rocha: research

Evolution! Improving sentiment analysis

Methodology

Expected results

The field:

Sentiment analysis

*"Sentiment analysis or opinion mining is
the computational study of opinions,
sentiments and emotions expressed in
text"*

(Liu, Bing)

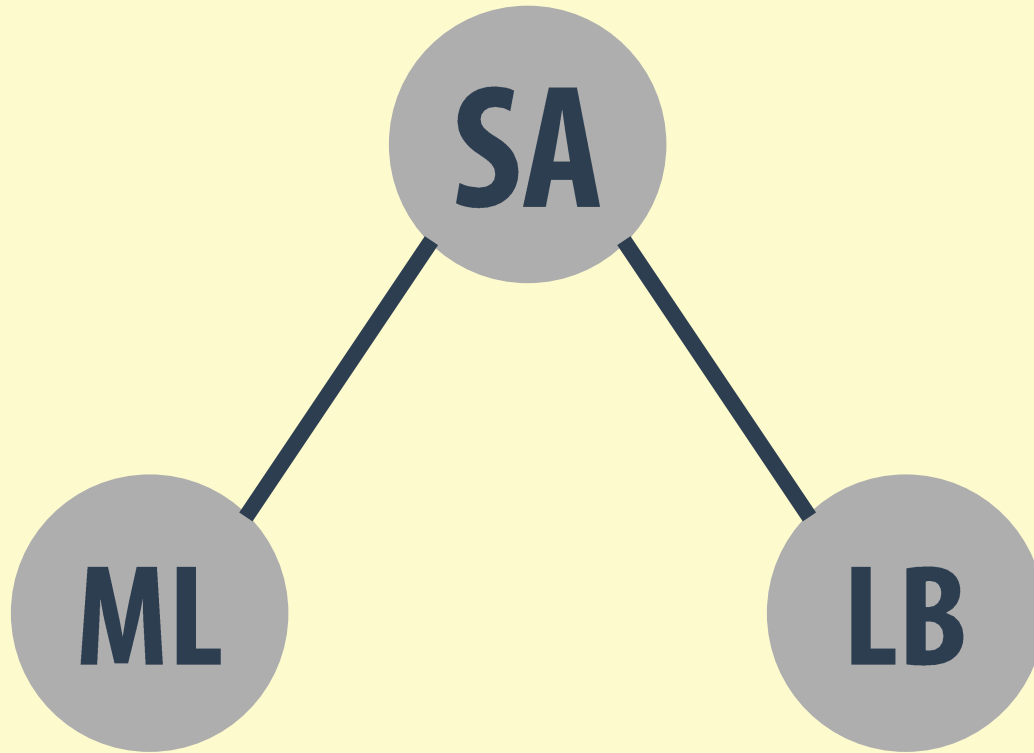

Or...

I loved the new Spider Man movie,
but I hated the poor performance of Andrew
Garfield as Peter Parker

I loved the new Spider Man movie,
but I hated the poor performance of Andrew
Garfield as Peter Parker

I loved the new Spider Man movie,
**but I hated the poor performance of
Andrew Garfield as Peter Parker**

PoS tag

Prior polarity

Polarity shifters

Specific sets of words

Machine Learning

Main algorithms are...

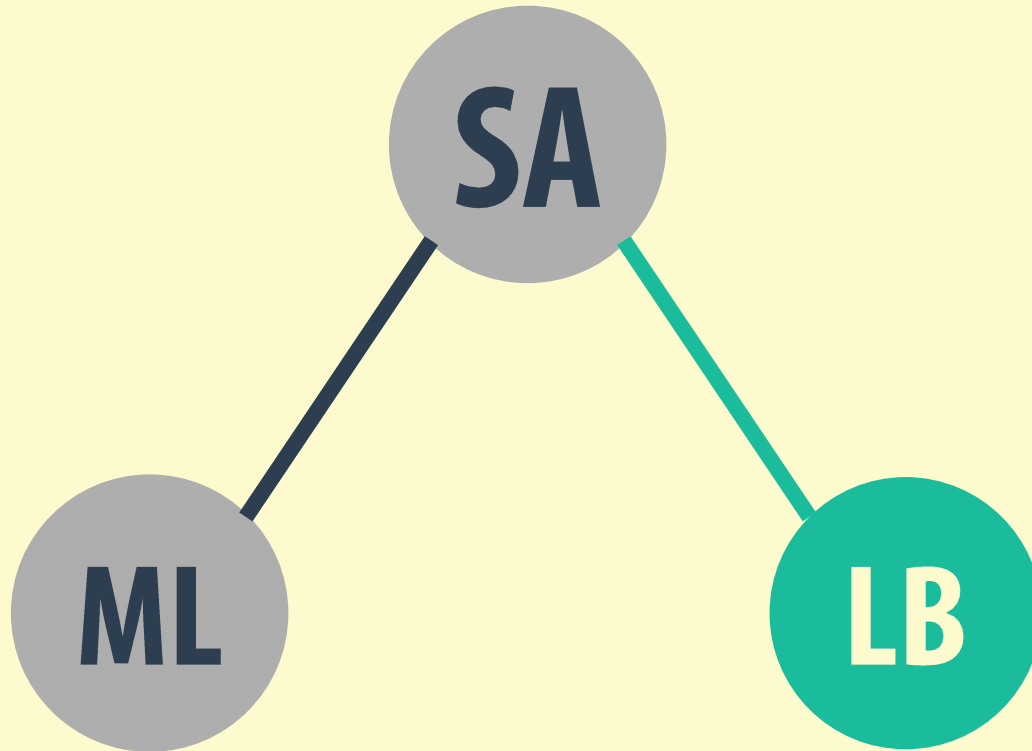

Naive Bayes

Assumes that all the features are independent and equally important

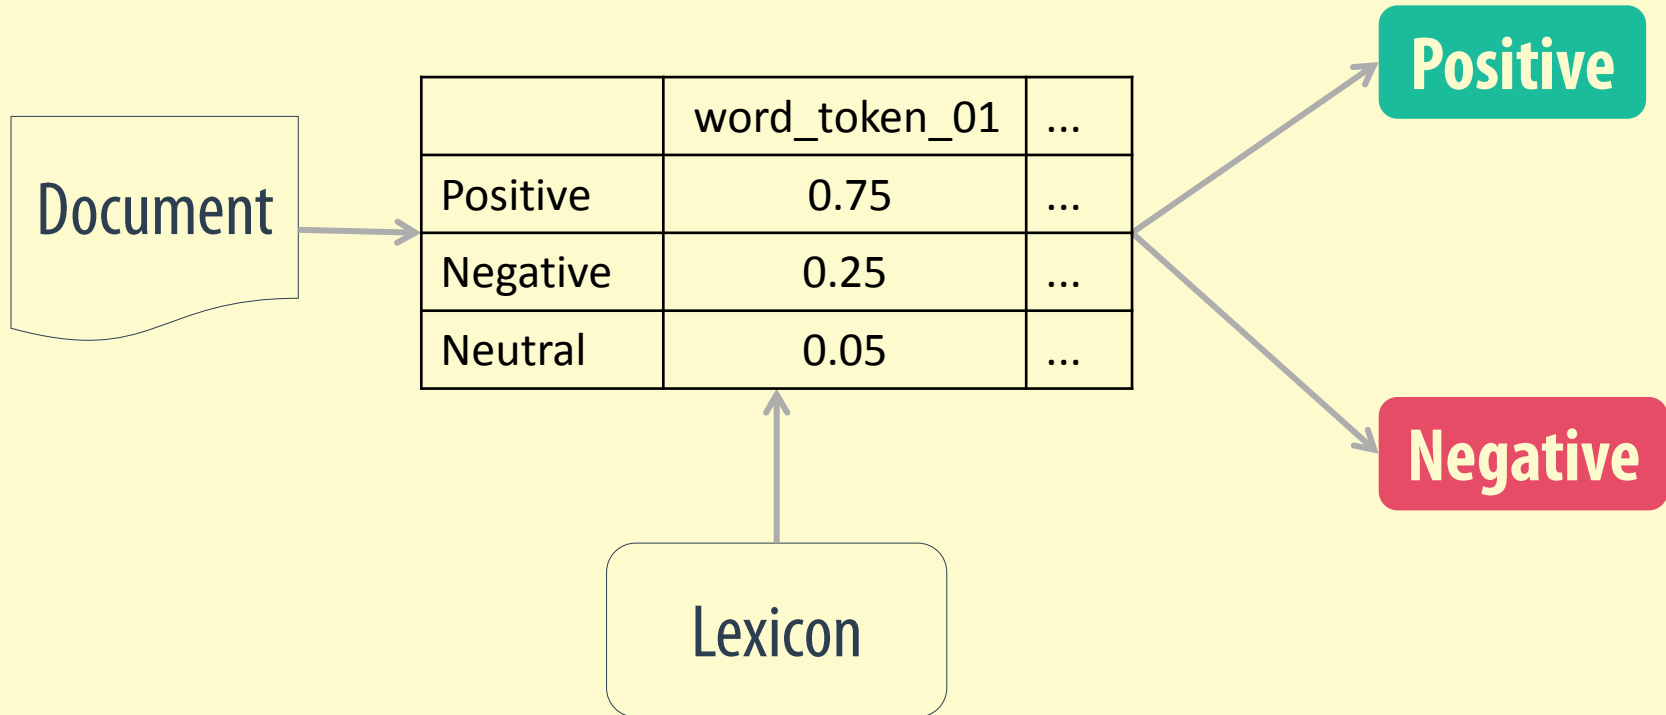

Support Vector Machines

Has the ability to define the most important features

Silva&Rocha: research

Dataset

Topic: entrepreneurship/startups

Automatically acquired using crawler

180 articles with 4563 sentences

Goal

Show that it's possible to create accurate SA classifiers using data provided by untrained annotators

Pipelines

Initial data classification

Annotation and final classification

Methodology

Pipelines

Initial data classification

Annotation and final classification

Classifier: naive Bayes

Features: unigrams

Approach: Generated different training data and compare results of the classifiers trained with them

Evolution!

Improving sentiment
analysis

Goal

To study how the process to generate word prior polarity feature impacts the accuracy of the sentiment classification task

Methodology

1

Framework to
generate complex
features

2

Sentiment
classification task

3

Experiment

Methodology

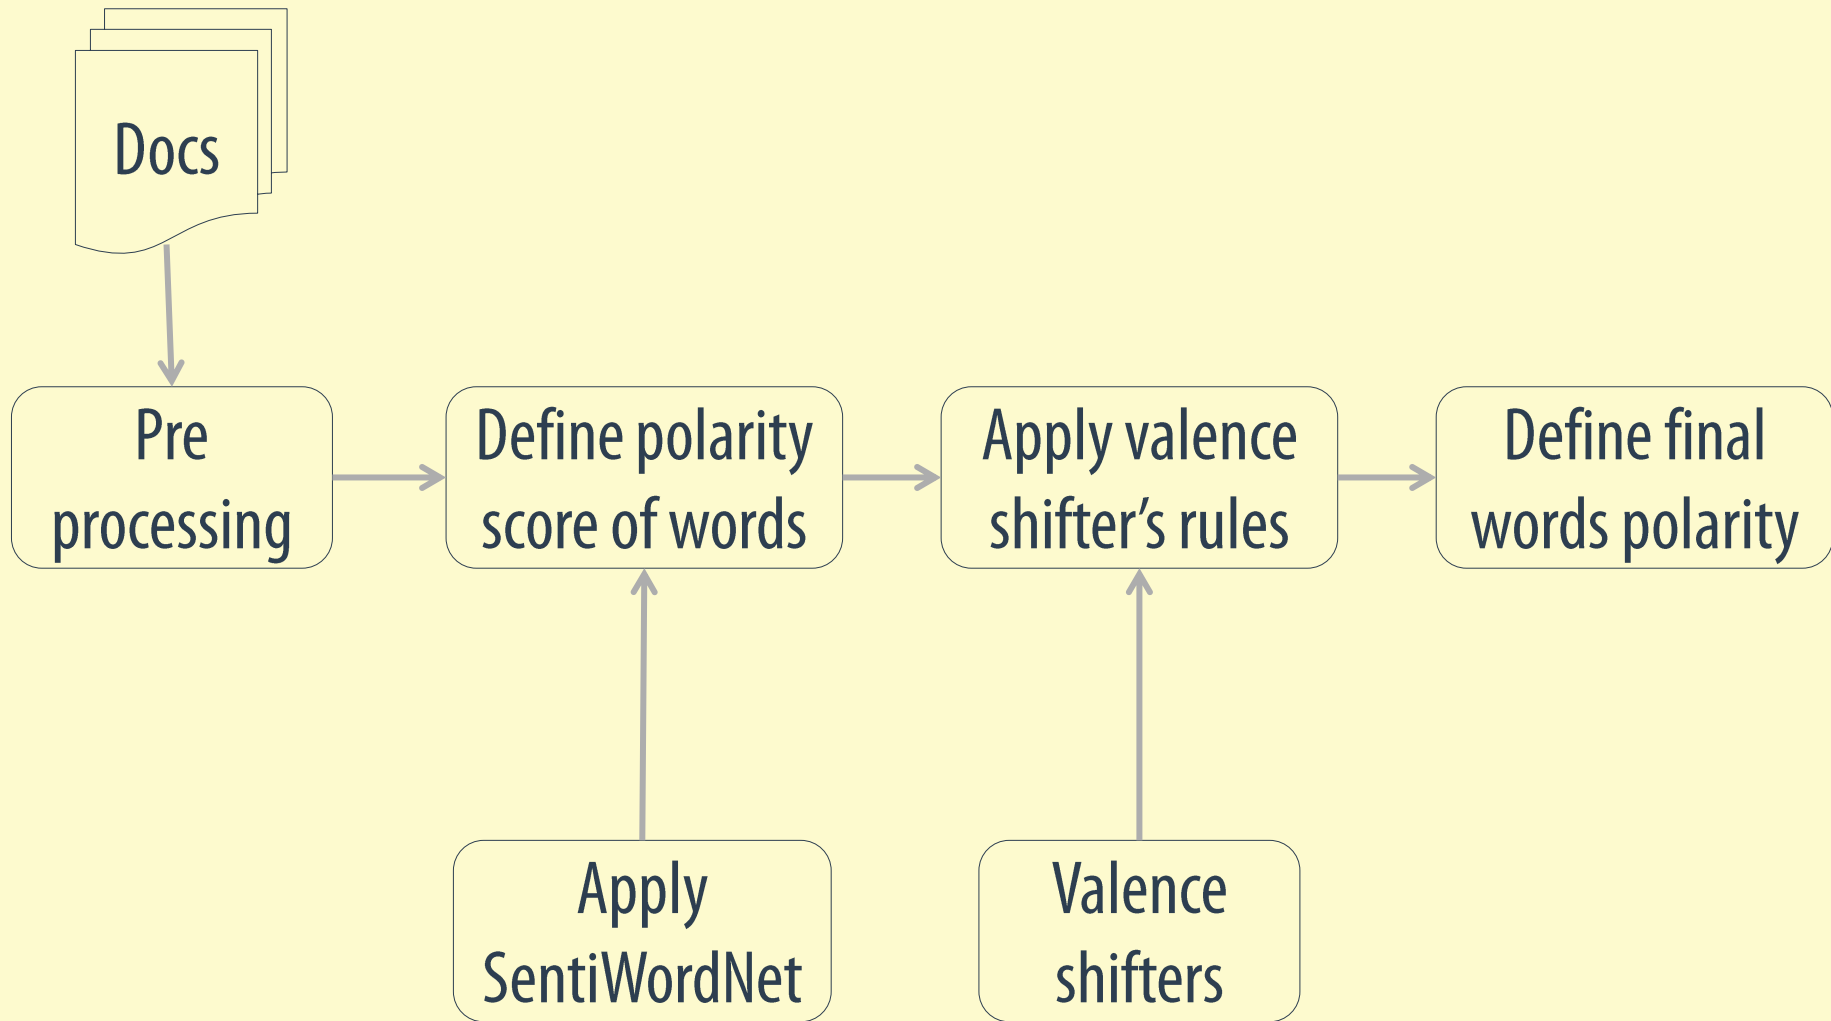

**Framework to
define polarity of
words**

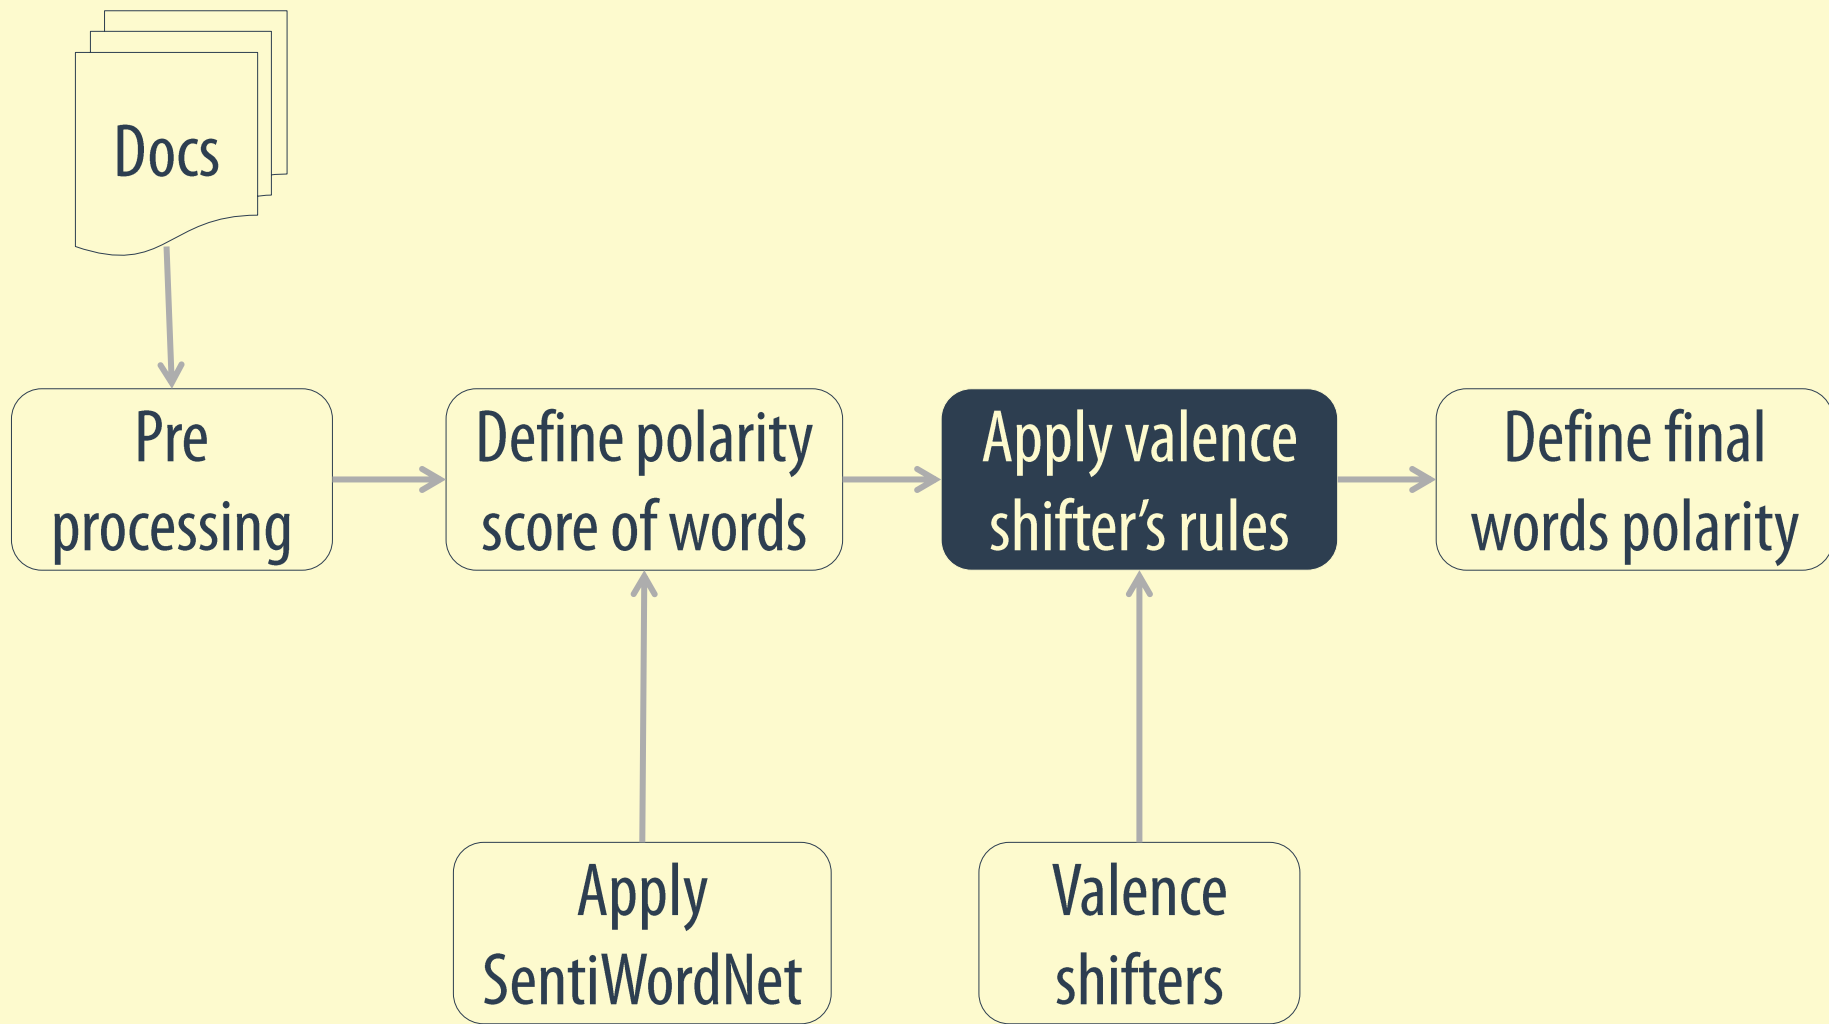

**Sentiment
classification task**

Experiment

This is good	$.75$
This is really good	$.1 + .75$
This is not good	$1 - .75 $
This is not really good	$1 - .1 + .75 $
This is bad	$-.625$

Methodology

1

Framework to
define polarity of
words

2

**Sentiment
classification
task**

3

Experiment

Classification

Features

this	is	good	really	not	bad
0.0	0.0	.75	0.0	0.0	0.0
0.0	0.0	.85	0.0	0.0	0.0
0.0	0.0	-.25	0.0	0.0	0.0
0.0	0.0	-.15	0.0	0.0	0.0
0.0	0.0	0.0	0.0	0.0	-.625

Classification

Classifier: Support Vector Machines

10-fold cross validation to define best params

Methodology

Framework to
define polarity of
words

Sentiment
classification task

Experiment

Experiment

Compare:

Baseline (Silva&Rocha)

Support Vector Machines
with different windows for
shifters

Precision, recall and F-score to define accuracy

**Expected
results**

We believe that...

Negation shift >> Negation switch

Window of structure >> Window of words

SVM >> naive Bayes

Thank you!
